The iPhone Meets the Fourth Amendment

Adam M. Gershowitz*

Imagine that Dan Defendant is stopped by the police for driving through a stop sign. The officer thinks that Dan looks suspicious, but has no probable cause to believe he has done anything illegal, other than driving recklessly. Nevertheless, because running a stop sign is an arrestable offense and the officer is suspicious that Dan might be involved in more serious criminal activity, the officer arrests Dan for the traffic violation.

Under the search incident to arrest doctrine, officers are entitled to search the body of the arrestee to ensure that he does not have weapons or will not destroy any evidence. The search incident to arrest is automatic and allows officers to open containers on the person, even if there is no probable cause to believe there is anything illegal inside of those containers. For instance, a standard search incident to arrest often turns up drugs located in a small container such as a cigarette pack. Yet, Dan does not have a cigarette pack in his pocket; instead, like millions of other technophiles, Dan is carrying an iPhone.

The officer removes the iPhone from Dan's pocket and begins to rummage through Dan's cell phone contacts, call history, emails, pictures, movies, and, perhaps most significantly, the browsing history from his use of the internet. In addition to finding Dan's personal financial data and embarrassing personal information, the police also discover incriminating pictures of stolen contraband, emails evidencing drug transactions, and internet surfing of websites containing child pornography. Is all of this evidence admissible even though Dan has only been arrested for a traffic infraction and there was no probable cause (not to mention no warrant) to search the contents of his iPhone? When one considers the breadth of information located in Dan's iPhone, it would seem shocking that officers need no suspicion whatsoever in order to search through that information. Yet, that conclusion appears to follow from longstanding Supreme Court precedent laid down well before handheld technology was even contemplated.

This article demonstrates how the full contents and multiple applications of iPhones can be searched without a warrant or probable cause under existing Supreme Court precedent. The article also offers approaches courts and legislatures might adopt to ensure greater protection for the soon-to-be pervasive iPhone devices.

Introduction

The iPhone may turn out to be the most popular invention of the decade. Before its release in July 2007, crowds lined up for days to be among the first to

* Associate Professor, South Texas College of Law. I am grateful to John Blevins, Dale Carpenter, Sharon Finegan, John W. Hall, Orin Kerr, Dan Markel, Usha Rodrigues, and Andrew Solomon for helpful comments.

get the device.[1] In the first three days on the market, Apple sold more than a quarter-of-a-million[2] iPhones and the company has said it expects more than 10 million devices to be purchased worldwide by the end of 2008.[3] And unlike many technological releases, customer satisfaction seemed to meet or exceed expectations.[4] Thus, sales can be expected to remain strong with competing companies following suit with similar products.[5]

For those who have not had the opportunity to tinker with one, the iPhone is a handheld wireless device that functions as a cell phone, blackberry, camera, music player, and video player, while simultaneously providing internet access. In short, for those on-the-go, the iPhone packages multiple applications into a single device small enough to fit into your back pocket. It does not take a crystal ball to predict that such devices will be omnipresent in the United States within a few years. Just as almost everyone for the last few years has had a conventional cell phone at their disposal, it seems likely that tens of millions of Americans will be driving around with iPhones or a competing product in their pockets or purses within the next few years.[6]

While the iPhone is a wonderful technological innovation and its proliferation will no doubt improve everyday life, it comes with unexplored legal repercussions. Specifically, what type of Fourth Amendment protection should such devices receive? Can they be searched without a warrant or without probable cause at a conventional traffic stop? And if so, how far can law enforcement explore the contents of the devices without violating the Constitution? In conducting a warrantless search of the handheld device, are

[6] Although there are competing products, for ease of exposition I will simply refer to iPhones throughout this article.

officers limited to scanning the displayed screen of an iPhone, or are they permitted to manipulate the touch screen to open picture files or an internet browser? And once those functions are open, how deep can officers continue to look? Must the police stop when they see nothing illegal in a list of displayed emails, or can they open different email folders and begin to read messages? If the history page of an internet browser lists a website that might suggest child pornography – for instance, "www.questionable-pornography-here.com" – can the officer click on the hyperlink to bring up the website? If the website page comes up and it appears that the arrestee had used a saved password to enter the site previously, can the officer click on the "submit" button to move beyond the front page and into the salacious content?

Obviously, the framers of the Fourth Amendment could not have conceived of a handheld technological device like the iPhone,[7] and courts have not yet been called upon to answer most of the difficult questions posed by such devices.[8] Yet, current Fourth Amendment doctrine strongly suggests that the Supreme Court would authorize invasive searches of the iPhones found in pockets or purses of many individuals.

For nearly four decades,[9] the search incident to arrest doctrine has functioned as a bright-line rule allowing police to search the entire person of an arrestee without getting into sticky questions of whether there was probable

---

[7] A large body of Fourth Amendment scholarship focuses on unforeseen technological changes making it easier for law enforcement to investigate criminal activity. For an excellent example deviating from the view that all advances merit greater court involvement, see Orin S. Kerr, *The Fourth Amendment and New Technologies: Constitutional Myths and the Case for Caution*, 102 MICH. L. REV. 801 (2004). The iPhone scenario inverts the problem however by placing the advanced technology in the hands (or pockets) of the one being searched, rather than the officer doing the searching.

[8] A handful of courts have been asked to decide whether a search of a traditional cell phone's call history or text messages is permissible incident to arrest. With very narrow exceptions, those courts have upheld the searches as valid. *See infra* notes 64-77 and accompanying text.

[9] Scholars convincingly maintain that the search incident to arrest doctrine is more than nine decades old. *See* James J. Tomkovicz, *Divining and Designing the Future of the Search Incident to Arrest Doctrine: Avoiding Instability, Irrationality, and Infidelity*, 2007 U. ILL. L. REV. 1417 (dating the search incident to arrest exception back to Weeks v. United States, 232 U.S. 383 (1914) and Carroll v. United States, 267 U.S. 132 (1925)). The modern incarnation of the doctrine can be traced to the Supreme Court's decisions in the 1960s and 1970s.

cause or reasonable grounds to open a particular container.[10] While society and technology have changed drastically over the last few decades, the search incident to arrest rule has remained static.[11] Thus, if we think of an iPhone as a container[12] -- like a cigarette package or a closed box -- police can open and search the contents inside with no questions asked and no probable cause required, so long as they are doing so pursuant to a valid arrest. And as scholars have long recognized, states have expansive criminal codes giving police authority to arrest for a huge number of criminal infractions.[13] Thus, police officers with nothing more than a hunch of illegal activity may arrest an

---

[10] *See* United States v. Robinson, 414 U.S. 218, 235 (1973) ("The authority to search the person incident to a lawful custodial arrest, while based upon the need to disarm and to discover evidence, does not depend on what a court may later decide was the probability in a particular arrest situation that weapons or evidence would in fact be found upon the person of the suspect. A custodial arrest of a suspect based on probable cause is a reasonable intrusion under the Fourth Amendment; that intrusion being lawful, a search incident to the arrest requires no additional justification."); Chimel v. California, 395 U.S. 752 (1969).

[11] As explained below (*see infra* notes 26-49 and accompanying text), the Supreme Court has drastically expanded the reach of the search incident to arrest exception. As Professor Tomkovicz has chronicled in his recent article, over the last few decades "the Court [has] modestly, but consistently, increased the scope of law enforcement authority to conduct automatic searches following lawful arrests." Tomkovicz, *supra* note 9 at 1441. By "static," I mean only that the Court has not accounted for new technology. On the need for new rules of criminal procedure to deal with an increasingly digital world, see Orin S. Kerr, *Digital Evidence and the New Criminal Procedure*, 105 COLUM. L. REV. 279 (2005) (arguing that existing law is tailored toward tangible evidence in a way not suited to dealing with digital information).

[12] *See* Orin S. Kerr, *Searches and Seizures in a Digital World*, 119 HARV. L. REV. 531, 538 (2005) (explaining that "computer searches and home searches are similar in many ways. In both cases, the police attempt to find and retrieve useful information hidden inside a closed container" yet also describing significant differences between computer data collection and conventional searches).

[13] *See* William J. Stuntz, *The Pathological Politics of Criminal Law*, 100 MICH. L. REV. 505, 507 (2001) ("American criminal law, federal and state, is very broad; it covers far more conduct than any jurisdiction could possibly punish. The federal code alone has thousands of criminal prohibitions covering an enormous range of behavior, from the heinous to the trivial. State codes are a little narrower, but not much."); Henry Hart, *The Aims of the Criminal Law*, 23 LAW & CONTEMP. PROBS., 401, 431 (1958) ("What sense does it make to insist upon procedural safeguards in criminal prosecutions if anything whatever can be made a crime in the first place?").

individual for a simple traffic violation[14] and proceed to search thousands of pages of private data located on the iPhone found in the arrestee's pocket.[15]

Part I of this article provides an overview of the history and scope of the search incident to arrest exception to the warrant requirement. Part II reviews the handful of cases dealing with searches of conventional cell phones and pagers incident to a lawful arrest. Part III then explains the complicated problems that develop when the doctrine is applied to iPhones. Finally, Part IV offers a number of approaches that courts and legislatures could adopt to narrow the scope of warrantless searches of iPhones and similar handheld wireless devices.

I. The Search Incident to Arrest Doctrine as a Search for Bright Line Rules

The Fourth Amendment provides that "no warrants shall issue but upon probable cause."[16] Yet, as any criminal procedure student knows, the Supreme

---

[14] *See, e.g.*, Atwater v. City of Lago Vista, 532 U.S. 318 (2001) (finding no constitutional violation in arresting a driver for failure to wear a seatbelt and searching incident to that arrest). This problem is what Professor Donald Dripps has referred to as the "iron triangle" in which police can pull over an automobile for pretexual reasons (so long as they can point to an almost unlimited number of traffic violations), arrest individuals for almost any low level misdemeanor infraction, and then proceed to search the individual for contraband totally unrelated to the stop and arrest. *See* Donald A. Dripps, *The Fourth Amendment and the Fallacy of Composition: Determinacy Versus Legitimacy in a Regime of Bright-Line Rules*, 74 MISS. L.J. 341, 393 (2004) ("The Iron Triangle means in practice that the police have general search power over anyone traveling by automobile.").

[15] Police will also likely conduct warrantless searches of iPhones at traffic stops under the consent and automobile exceptions, though far less often than under the search incident to arrest doctrine. Under the former, police will be permitted to search the contents of an iPhone if a reasonable person would have thought his consent extended that far. *See, e.g.*, United States v. Reyes , 922 F. Supp. 818 (S.D.N.Y. 1996) (finding that consent to search a car in which suspect was traveling extended to a search of a pager found inside the car). Under the automobile exception, police will be permitted to search the contents of the iPhone at a traffic stop if they have probable cause to believe it contains evidence of the crime they are investigating. For instance, if police have probable cause to believe the owner of the iPhone is utilizing the phone's text message function to facilitate drug dealing, police could look through the text messages of an iPhone found in a vehicle. *See* California v. Acevedo, 500 U.S. 565 (1991) (allowing police to open containers in an automobile without a warrant).

[16] U.S. Const. Amend. IV.

Court has long recognized a slew of exceptions allowing the police to search without first procuring a warrant.[17] For purposes of this essay, there is one exception of particular significance -- perhaps the most common rationale for police to search without a warrant[18] – the search incident to arrest doctrine.

The history of the search incident to arrest exception dates back to the creation of the exclusionary rule itself in 1914, when the Supreme Court obliquely suggested in dictum that the government has the right "to search the person of the accused when legally arrested, to discover and seize the fruits or evidences of crime."[19] Although the Court alluded to such searches in that case and a handful of other early decisions,[20] the doctrine's modern starting point can be traced to the 1969 decision in *Chimel v. California*.[21]

In *Chimel*, police arrested a suspect in his home for burglary and proceeded to search the entire three-bedroom house, as well as the attic and garage, for proceeds of that burglary.[22] While the Court found this warrantless search to be unconstitutionally broad, it nevertheless recognized that police can search suspects incident to arrest in narrower circumstances. The Court explained that a search incident to arrest must be limited to a search for weapons that an arrestee could use against the officer and to prevent an arrestee from concealing or destroying evidence.[23] The Court concluded that a search for weapons and evidence must be limited to the arrestee's person and the area within his immediate control from which he might gain possession of a weapon

---

[17] Exceptions to the Fourth Amendment's warrant requirement are so pervasive and disorganized that Professor Akhil Amar has referred to Fourth Amendment jurisprudence as "a sinking ocean liner – rudderless and badly off course." Akhil Amar, *Fourth Amendment First Principles*, 107 HARV. L. REV. 757, 759 (1994).

[18] *See* WAYNE R. LAFAVE, 3 SEARCH AND SEIZURE: A TREATISE ON THE FOURTH AMENDMENT § 5.2 (2007) (describing the search incident to arrest as probably the most common type of police search).

[19] Weeks v. United States, 232 U.S. 383, 392 (1914).

[20] For a recent and excellent discussion of the history of the doctrine, *see* Tomkovicz, *supra* note 9, at 1421-45.

[23] *See id*. at 763.

or destroy evidence.[24] The Court specifically rejected the contention that police could search areas beyond which an arrestee could grab a weapon or evidence.[25]

A few years after *Chimel*, the Supreme Court addressed the question of whether police could open closed containers located on an arrestee's person. In *United States v. Robinson*, police arrested a suspect for operating a motor vehicle with a revoked license.[26] In searching Robinson incident to arrest, the officer felt an object in his coat pocket but could not tell what it was.[27] The officer reached into the pocket and pulled out a "crumpled up cigarette package."[28] Still not sure what was in the package, the officer opened it and discovered capsules of heroin.[29] In rejecting Robinson's challenge to the search, the Court made clear that officers conducting a search incident to arrest can open and search through all items on an arrestee's person, even if they are in a closed container, and even if the officers have no suspicion that the contents of the container are illegal.[30] The Court explained that the search incident to arrest doctrine does not require case-by-case adjudication and that there need not be analysis of each step of the search to determine whether it was necessary to prevent the arrestee from acquiring weapons or destroying evidence.[31] Rather, *Robinson* made clear that searches of the arrestee's person and the containers thereon can be conducted automatically incident to an arrest. The Court's decision thus created a bright-line rule.

The Court's desire for a bright-line rule became even clearer eight years later in *New York v. Belton*.[32] In *Belton*, the officer stopped a car for speeding and, upon smelling marijuana, arrested the occupants.[33] With the occupants away

from the vehicle, the officer then searched the passenger compartment of the car and found a jacket in the backseat. The officer unzipped the pockets of the jacket and found cocaine.[34] Praising its decision in *Robinson*, the Court said that police officers must be afforded "a straightforward rule, easily applied and predictably enforced."[35] Lamenting that there was not yet such straightforward rule for the search of the interior of a car at a traffic stop, the Court adopted another bright-line rule permitting the search of the entire passenger compartment of an automobile when an occupant of the car is lawfully arrested.[36] Just as in *Robinson*, the Court made clear that the bright-line rule would apply even if there were no chance that an arrestee could break free of his restraints to grab a weapon or destroy evidence in the passenger compartment of the car. The Court further explained that the search of the passenger compartment included any containers found therein, whether open or closed, and irrespective of whether they could contain a weapon or evidence.[37] The *Belton* decision marked a considerable expansion of the search incident to arrest doctrine.[38]

The Court's last significant search incident to arrest decision came in 2004 in *Thornton v. United States* where an automobile was again the focus of attention.[39] Unlike the occupant in *Belton*, the *Thornton* case involved a driver who had already exited and walked away from his vehicle before being approached by police.[40] After Thornton was arrested for drug possession, the

---

[34] *See id*. at 456.

[35] *Id*. at 459.

[36] *See id*. at 460.

[37] *See id*. at 461. The Court did not make clear in *Belton*, nor has it in any subsequent cases, whether locked containers in an automobile can be opened incident to arrest. For a survey of the lower court authority, see LAFAVE, SEARCH AND SEIZURE, *supra* note 18, at § 7.1 n.99. Likewise, the Court has never squarely addressed the question of whether the "trunk" portion of an SUV, station wagon, or hatchback qualifies as being part of the passenger compartment of the vehicle. *See, e.g.*, Sellman v. State, 828 A.2d 803, 818 (Md. App. 2003) (describing the issue of whether a hatchback is in the passenger compartment as a "fact-bound question"). For a long list of cases reaching different conclusions on this issue, see LAFAVE, SEARCH AND SEIZURE, *supra* note 18, at § 7.1 n.96.

[38] *See* Tomkovicz, *supra* note 9 at 1437 (explaining that the Belton Court "was instigating a new era of expansion for search incident authority").

[39] 541 U.S. 615 (2004).

[40] *See id*. at 618.

officer then proceeded to his vehicle and searched the passenger compartment incident to arrest, finding a handgun under the seat, which led to a charge of possessing a firearm in furtherance of a drug trafficking crime.[41] The Court once again stressed the need for a "clear rule, readily understood by police officers, and not depending on differing estimates of what items were or were not within reach of an arrestee at any particular moment."[42] In rejecting Thornton's suppression argument, the Court extended the *Belton* rule to permit a full-scale search of the passenger compartment of a vehicle incident to the arrest of a "recent" occupant of a vehicle.[43]

The Court's decisions over the last forty years suggest that the search incident to arrest exception to the warrant requirement should be interpreted very expansively. Indeed, in *Belton*, the Court specifically stated that "container" should be interpreted broadly to include "any object capable of holding another object. It thus includes closed or open glove compartments, consoles, or other receptacles located anywhere within the passenger compartment, as well as luggage, boxes, bags, clothing, and the like."[44] Consistent with this guidance, lower courts have taken a broad approach and upheld searches of numerous small containers incident to arrest, such as wallets,[45] envelopes,[46] and aspirin

---

[41] *See id.*

[42] *Id*. at 623.

[43] *See id*. at 623-24. Ironically, the Court's celebration of a bright-line approach makes little sense when the Court has provided no guidance as to who is a "recent occupant" of a vehicle. *See* George Dery & Michael J. Hernandez, *Turning a Government Search Into a Permanent Power: Thornton v. United States and the "Progressive Distortion of Search Incident to Arrest*, 14 WM. & MARY B. RIGHTS J. 677, 698 (2005) ("The stage is thus now set for needless litigation as to the boundaries of Thornton's not-so-bright-line rule. Attorneys in the courts and officers on the beat will struggle in their attempts to determine who qualifies as a "recent occupant" of a vehicle. The spawning of case after case attempting to clarify the outer boundaries of *Thornton*'s time and space rule creates the very confusion *Belton* originally aimed to avoid.").

[44] *Belton*, 453 U.S. 460 n.4.

[45] *See, e.g.*, United States v. Rodriguez, 995 F.2d 776, 778 (7th Cir. 1993) (permitting search of wallet and photocopying of address book incident to arrest); United States v. Hatfield, 815 F.2d 1068, 1071-72 (6th Cir. 1987) (upholding search of wallet incident to arrest and the admission of lock picks found in the wallet); State v. Winston 295 S.E.2d 46 (W. Va. 1982) (search of wallet upheld)

bottles.[47] Although some state courts have interpreted their own constitutions and criminal codes to be more restrictive than the United States Constitution,[48] most lower courts have not hesitated to apply the search incident to arrest doctrine to new situations unforeseen by the Supreme Court of the United States.[49]

II. Bright Line Rules in an Era of Pagers and Cell Phones

The Supreme Court's decisions in *Robinson* and *Belton* made clear that, incident to a lawful arrest, officers can open containers located on a person or in their immediate grabbing space without having any independent probable cause to search those containers.[50] For many years, the only evidence found as a result of such searches was tangible physical evidence, such as drugs or illegal weapons. As technology has advanced however, a handful of lower courts have been forced to confront non-tangible digital evidence located in electronic devices on arrestees' persons, specifically pagers, cell phones, and computers. These courts have been forced to confront whether the search incident to arrest doctrine – which was designed with a world of tangible evidence in mind – should apply to data "contained" in electronic devices. Most courts have upheld such searches.

The earliest of these electronic data cases (and consequently the most primitive of the technology at issue) was a 1993 decision from the Southern District of New York dealing with a pager found on an arrestee.[51] The defendant, Chan, was arrested as part of a drug sting operation and police found

---

[46] *See, e.g.*, United States v. McCrady, 774 F.2d 868, 872 (8th Cir. 1985) (upholding search of envelope found in locked glove compartment).

[48] *See, e.g.*, State v. Stroud, 720 P.2d 436 (Wash. 1986) (en banc) (relying on state constitution to conclude that police may not search a locked glove compartment incident to arrest without procuring a warrant).

[49] *See, e.g.*, *supra* notes 45-47.

[50] *See* Wayne A. Logan, *An Exception Swallows a Rule: Police Authority to Search Incident to Arrest*, 19 YALE L. & POL'Y REV. 381, 381 (2001) ("Compared to Fourth Amendment jurisprudence more generally, with its well-earned reputation for complexity and variability, the search incident to arrest exception to the Amendment's warrant requirement would appear an oasis of consistency.").

[51] United States v. Chan, 830 F. Supp. 531 (N.D. Cal. 1993).

a pager on Chan's person.[52] The police then activated the pager's memory function and retrieved telephone numbers stored inside it.[53] Two numbers found in the pager linked Chan to the drug sting the police were conducting.[54] Chan contended that he had a reasonable expectation of privacy in the pager and that activating it amounted to a search that required a warrant.[55] The court sided with Chan in part by agreeing that a pager is analogous to a closed container and that individuals have a reasonable expectation of privacy in the contents of electronic containers.[56] However, the court ultimately concluded that because the search of the pager came on the heels of a lawful arrest of Chan, a warrantless search was permitted under the search incident to arrest doctrine.[57] Citing *Belton* and *Chimel*, the court concluded that all containers can be searched incident to a lawful arrest, including electronic containers.[58] Moreover, the court considered and specifically rejected as irrelevant the fact that Chan could not retrieve a weapon from the pager nor plausibly destroy any evidence from the pager.[59] Accordingly, the evidence found when the officer turned on and searched the pager was admissible.

Over the next few years, a handful of other courts were called upon to analyze the question raised in *Chan* and these courts likewise permitted the search of the contents of a pager incident to arrest.[60] These courts reiterated that

Stroud, 1994 WL 711908 (9th Cir. Dec. 21, 1994) (same); United States v. Diaz-Liazaraza, 981 F.2d 1216 (11th Cir. 1993) (inserting batteries and reactivating beeper so that it may be called after arrest is permissible); United States v. Reyes, 922 F. Supp. 818 (S.D.N.Y. 1996) (upholding retrieval of numbers from a pager); United States v. Lynch, 908 F. Supp. 284 (D. Vi. 1995) (same).

the search incident to arrest exception allows police to open all containers on a person and further explained that pagers are analogous to a wallet or address book, which courts have long permitted police to search incident to a lawful arrest.[61] One court further recognized that it was especially important to search pagers quickly because an incoming page could destroy existing numbers currently stored in the pager's memory.[62]

The era of pagers has all but ended, making way for the age of cell phones. At first, cell phones were used primarily for phone calls, but in recent years text messages have become a very commonly used feature as well.[63] To date, fewer than a dozen courts have addressed searches of cell phones incident to arrest. The Fifth Circuit's recent 2007 decision in *United States v. Finley* is representative.[64] Police arrested Finley after a staged drug sale.[65] The police then searched Finley incident to arrest and found a cell phone in his pocket.[66] One of the investigating officers searched through the phone's records and found text messages that appeared to relate to drug trafficking.[67] One incoming text message said "So u wanna get some frozen agua," a common term for methamphetamine.[68] Another text message said "Call Mark I need a 50," a likely reference to asking for $50 worth of narcotics.[69] Finley was convicted of aiding and abetting drug possession with intent to distribute.[70]

[69] *Id*.

On appeal, Finley contended that the search of his cell phone was unlawful. The Fifth Circuit rejected Finley's contention that the cell phone could be seized but not searched.[71] Relying on the "standard" search incident to arrest caselaw – namely *United States v. Robinson* and *New York v. Belton*[72] -- the court explained that "police officers are not constrained to search only for weapons or instruments of escape on the arrestee's person; they may also, without any additional justification, look for evidence of the arrestee's crime on his person in order to preserve it for use at trial."[73] The court further explained that police can open containers found on the arrestee's person and saw no reason why the doctrine should not be extended to text messages contained in a cell phone.[74]

In short, the Fifth Circuit did not recognize any conceptual difference between searching a person's body or physical containers on that body for drugs and searching electronic equipment for digital information. A handful of district courts have reached the same conclusion as the Fifth Circuit and admitted evidence seized from cell phones.[75]

[75] *See* United States v. Valdez, 2008 WL 360548 (E.D. Wis. Feb. 8, 2008) (upholding search of cell phone's address book and call logs incident to arrest, though noting that "we can leave for another day the propriety of a broader search equivalent to the search of a computer"); United States v. Curry, 2008 U.S. Dist. LEXIS 5438 (D. Me. Jan. 23, 2008) (upholding search of cell phone for call logs from drug informant); United States v. Lottie, 2007 WL 4722439 (N.D. Ind. Oct. 12, 2007) (upholding search of cell phone primarily on exigency grounds but arguably under the search incident to arrest exception as well); United States v. Mercado-Nova, 486 F. Supp. 2d 1271 (D. Kan. 2007) (upholding search of cell phone for numbers of outgoing and incoming calls); United States v. Zamora, 2006 WL 418390 (N.D. Ga. 2006) (same); United States v. Murphy, 2006 WL 3761384 (W.D. Va. 2006) (upholding search of cell phone's text messages); United States v. Diaz, 2006 WL 3193770 (N.D. Cal. Nov. 2, 2006) (upholding recording of names and numbers in address book and recording messages); United States v. Cote, 2005 WL 1323343 (N.D. Ill. May 26, 2006) (upholding search of cell phone's call log, phone book, and wireless web inbox); United States v. Brookes, 2005 WL 1940124 (D. VI. June 16, 2005) (upholding search of numbers in cell phone and pager); United States v. Parada,

To be sure, two lower courts have suppressed evidence found on cell phones pursuant to a search incident to arrest. Yet, those decisions were primarily on grounds that the search took place too long after the arrest to be a contemporaneous search incident to arrest.[76]

Perhaps the reason for the lack of contrary authority is that searching a conventional cell phone or pager incident to arrest is relatively easy to square with the "standard" precedent that permits police to search tangible containers found on an arrestee.[77] A cell phone's memory of incoming and outgoing calls,

---

289 F. Supp. 2d 1291 (D. Kan. 2003) (upholding search of stored numbers to prevent destruction of evidence).

[76] *See* United States v. La Salle, 2007 WL 1390820 (D. Hawaii May 9, 2007); United States v. Park, 2007 WL 1521573 (N.D. Cal. May 23, 2007); *cf.* United States v. Carroll, 2008 WL 313801 (N.D. Ga. Feb. 1, 2008) (expressing skepticism of search incident to arrest of a blackberry when a suspect surrendered at the police station, but ordering further briefing before deciding the issue). In *Park*, the court stated that "due to the quantity and quality of information that can be stored on a cellular phone, a cellular phone should not be characterized as an element of individual's clothing or person, but rather as a possession within an arrestee's immediate control that has fourth amendment protection at the station house." *Id*. at *9 (internal quotations omitted). This approach conceivably makes sense if the court is saying that the search of the cell phone was impermissible because it occurred too long after the arrest. But if the court is contending the search was instead invalid because it was a search of the possessions within the arrestee's immediate control rather than on his person, it is difficult to square with the Supreme Court's decision in New York v. Belton, 453 U.S. 454 (1981) and other cases that repeatedly reaffirm that a search incident to arrest extends to the person's grabbing space and area of immediate control. Perhaps for this reason, the *Park* decision stands contrary to eleven other decisions upholding the searches of cell phones incident to arrest and another seven decisions permitting the search of pagers incident to arrest. *See supra* notes 60 & 75 and accompanying text.

[77] More puzzling is why there are so few reported cases of police searching cell phones or pagers incident to arrest. One possibility is that such searches are regularly conducted, but no evidence is found. This would tend to make sense because unless police are actively investigating a case, a series of pager numbers or an address book of contacts may not be incriminating without further information. While text messages might be more immediately incriminating, it is only in the last few years that the text message craze has begun in earnest. A related possibility is that police are not yet regularly engaged in searching cell phones and electronic devices, possibly because they are so used to searching for tangible evidence such as drugs. A third explanation is that police are conducting such searches but that defendants plead guilty rather than continuing to challenge the search and risk conviction. In any event, the paucity of cases

as well as its text messages, can easily be compared to an address book or a letter in an envelope.[78] Much as the "standard" search incident to arrest cases permit police to open a wallet, take out a letter, and read it before the arrestee has an opportunity to destroy the evidence, it also makes sense to allow the police to review electronic call histories and text messages in a cell phone.[79] An arrestee with in-depth knowledge of how his cell phone operates could just as easily delete text messages or call logs as he could tear up a letter or shred an incriminating list of addresses on a piece of paper.

III. The Stakes and Likely Results When The iPhone Meets the Search Incident to Arrest Doctrine

To date, no court has been called upon to address the constitutionality of searching an iPhone. In light of the handful of cell phone and pager cases discussed by the lower federal and state courts,[80] it might seem that there is no difference in searching an iPhone. Just as text messages stored on a cell phone are evidence within a digital container, it would seem that call histories, emails, and pictures on an iPhone would simply be evidence stored in a (larger) digital container. As a conceptual matter there is no real difference between a crumpled up cigarette package, an early generation cell phone, and an iPhone with a much larger memory. Yet, this is cause for concern because no matter what the theoretical similarities are between an iPhone and a conventional cell phone (or a cigarette package for that matter), the former stores tremendously more information and stores it in a very different way. The differences can be demonstrated by thinking about how many steps or searches police might be able to take with respect to the new and old technology.

---

is not likely to last for long as iPhones will likely become an attractive target for police searching for evidence of illegal activity.

[78] *See, e.g.*, United States v. Rodriguez, 995 F.2d 776 (7th Cir, 1993) (upholding search of wallet and photocopying of address book incident to a lawful arrest); United States v. Meriwether, 917 F.2d 955, 958 (6th Cir. 1990) ("[T]he digital display pager, by its very nature, is nothing more than a contemporary receptacle for telephone numbers.").

[79] *See, e.g.*, United States v. Lynch, 908 F. Supp. 284 (D. Vi. 1995) (refusing to suppress data found from search of pager incident to arrest because the search of a pager for phone numbers is just like the search of a wallet or address book found on a person); *see also* United States v. Cote, 2005 WL 1323343 (N.D. Ill. May 26, 2006) (refusing to suppress data found on cell phone for same reason).

[80] *See supra* notes 51-76 and accompanying text.

The cell phone and pager cases decided by courts in the last few years are what we might call "first level" cases because they do not require in-depth searching to obtain evidence. Police need to push only a handful of buttons in order to reach pager numbers and only a handful of additional buttons to retrieve text messages. If we think of each step police that police must take to retrieve information as a separate search, then reviewing pager numbers might amount to only two levels of searches: first, pushing the memory button for the list of recent pages, and second scrolling through the numbers to find the incriminating calls. Reviewing text messages on a cell phone might be akin to three separate searches: (1) opening the text message function; (2) opening the list of received text messages; and (3) opening and reading the particular text message that is at issue. This is similar to the searches in *Robinson* where the police officer (1) felt the cigarette package; (2) pulled out the package; and (3) opened the package.

Put simply, there simply is not a lot of data on early generation cell phones, and police officers will either find the evidence or run into a dead end rather quickly. Accordingly, the degree of privacy invasion can be considered by exploring the number of steps an officer must take to retrieve the incriminating information. In the cases decided to date dealing with text messages and pagers, the number of steps has been small because those devices had few, relatively simple functions capable of storing electronic data. The same can be said for tangible evidence such as cigarette packages, purses, wallets, or suitcases.

The iPhone drastically changes this situation for two reasons. First, the iPhone stores tremendously more information thereby providing law enforcement with access to information that the typical arrestee would never carry in his pocket. In addition to the text messages, contact information, and call histories found on conventional phones, iPhones also contain an iPhoto function that holds far more pictures than could be stored on a conventional cell phone and displays them in much clearer detail. The iPhone also contains an easily accessible email application making it simple to access thousands of new, saved, and sent email messages. The iPhone permits users to store thousands of audio and video files. Music, books, and videos ranging from classical music to potentially obscene pornographic videos can be accessed with the touch of a few buttons.

Second, and perhaps more important than the data stored under these functions, the iPhone provides a mechanism for accessing information not presently stored on the phone. The iPhone contains an internet browser just like the one found on a standard computer. Thus, it can "dial out" and retrieve information not presently stored within the confines of the device. An example is instructive.

Imagine that an officer arrests an individual following a lawful traffic stop and finds an iPhone in the driver's pocket. The officer then takes the following steps: (1) activates the touch screen to view the phone's contents; (2) clicks on the internet browser icon; (3) clicks on the toolbar to find the bookmarks link; (4) finds a suspicious looking bookmark labeled "porn pictures"; (5) clicks on that particular bookmark to bring up the webpage; (6) sees that the webpage contains a series of icons including a "members" button and clicks on that image; (7) brings up the "members" page which has a saved account number and password already entered; (8) clicks on the "submit" button which utilizes the saved account information and password to bring up the content of the website; (9) sees that, in addition to pictures on the website, that there is also a message function and that the account owner has two new messages; (10) clicks on the message icon and brings up the two new messages, both of which reflect an incriminating conversation about exchanging pictures of under-age children.

Or imagine what might happen if an arrestee had password protected his iPhoto application to hide his photographs. After (1) turning on the iPhone; and (2) attempting to open the iPhoto application, the officer discovers that the application is password protected and cannot be opened.[81] The officer might

---

[81] The Supreme Court has not clearly determined whether officers can open a locked container, such as a glove compartment, during a search incident to arrest. Many courts have permitted such searches. *See, e.g.*, United States v. Woody, 55 F.3d 1257, 1269-70 (7th Cir. 1995); State v. Fry, 388 N.W.2d 565 (Wis. 1986). There is contrary authority however. *See* State v. Stroud, 720 P.2d 436 (Wash. 1986) (en banc) (relying on state constitution to conclude that police may not search a locked glove compartment incident to arrest without procuring a warrant). In a recent decision, a federal magistrate concluded that it would violate a defendant's Fifth Amendment protection against self incrimination to be compelled to provide the government with the password that encrypted a laptop found during a search at the Canadian border. *See* In re Boucher, 2007 WL 4246473 (D. Vt. Nov. 29, 2007). For criticism of the decision, see Sherry F. Colb, *Does the Fifth Amendment Protect the Refusal to Reveal Computer Passwords? In a Dubious Ruling, A Vermont Magistrate Judge Says Yes*, FINDLAW'S WRIT, Feb. 4, 2008 (available at http://writ.news.findlaw.com/colb/20080204.html). On the rise of computer searches at the border, see Adam Liptak, *If Your Hard Drive Could Testify*, N.Y. TIMES, Jan. 7, 2008 (discussing emerging cases in which the government compares searching a hard drive to rummaging through a suitcase); Ellen Nakashima, *Clarity Sought on Electronic Searches: Travelers' Devices Seized at Border*, WASH. POST, Feb. 7, 2008, at A1 (describing suspicionless searches of electronic data of international air travel passengers at the border, including requiring passengers to enter passwords into their laptops, copying the histories of websites visited on those laptops, reviewing documents saved in Microsoft Word, compiling lists of phone numbers in cell phones, and demands to see emails). For a scholarly assessment of the border searches, see Christine A. Coletta, Note

then (3) activate the internet browser; (4) click on the browsing history to see where the owner had been spending his time on the internet; (5) click on the history link that referenced the arrestee's web-based email account – for instance, yahoo or gmail; (6) read through the folders in the email account until finding one labeled "personal information"; (7) read through the messages in that folder until finding an email with the subject "passwords"; (8) open that email and retrieve the password for the iPhoto application; (9) close the internet browser and again click on the iPhoto application; (10) enter the password found in the email, thus opening the iPhoto application; (11) search through the folders in the iPhoto application, finding the most suspiciously labeled folder – for instance "kid pics"; (12) open that folder and open all of the pictures inside of that folder.

Countless other complicated scenarios could likewise be envisioned. As the scenarios become more complicated, it becomes harder to analogize them to a closed container or a wallet containing an address list. And indeed, the iPhone now provides access to information that would almost never before be found in arrestees' pockets or immediate grabbing space, but which now might be used to prosecute them with. For instance: (1) bank statements accessed via the saved password on your banking website[82] or (2) myspace or facebook webpages that have personal data, pictures, contacts, and exchanges of messages.[83]

Laptop Searches at the United States Borders and the Border Search Exception to the Fourth Amendment, 48 B.C. L. REV. 971 (2007).

[82] Banking data is a fertile source for prosecution. *See, e.g.*, Cassondra Kirby, *Two Lexington Women Indicted on Money Laundering Charges Accused of Bilking Millions for Luxuries*, LEXINGTON HERALD LEADER, Dec. 3, 2005, at B4 (recounting how a defendant denied money laundering charges but prosecutors said that "her bank records show otherwise").

[83] Prosecutors increasingly are finding Facebook and Myspace profiles to be a source of evidence. *See* Erica Perez, *Getting Booked by Facebook: Police Find That Students Are Incriminating Themselves Online*, MILWAUKEE JOURNAL SENTINEL, Dec. 18, 2007 ("Facebook.com and MySpace.com are the newest crime-busting tools in a police officer's repertoire, particularly for campus police, who are using the sites to investigate student crimes and violations and gather information about where students live and whom they know. In some cases, the information they find is making its way into court."); Michael Scarcella, *14 Are Targetted in Gang Sweep*, SARASOTA HERALD TRIB., July 7, 2007, at B1 ("A new trend in law enforcement has police surfing MySpace pages on the Internet for evidence in criminal cases"); Joseph Person, *Uploading Zone a Dangerous Place to Park*, THE STATE, May 28, 2006 (describing college athletes who videotaped their underage drinking and posted it online at Facebook).

In searching for incriminating information, officers will no doubt come into contact with extremely sensitive personal information that is not remotely illegal but which is nevertheless highly embarrassing. For instance, by searching an arrestee's internet browsing history, police might stumble across chat rooms demonstrating that the arrestee has unusual sexual proclivities. Or police might unearth that the arrestee is homosexual and trying to keep that information secret from her family or employer. If the arrestee is a politician, police might discover from his emails that he has been having an affair or that he made derogatory comments about other political figures. Additionally, an arrestee's internet browsing history or his bookmarked webpages might lead to a health insurance website that includes bills for a serious or embarrassing medical condition. The list of scenarios is endless. And while such embarrassing, but not incriminating, information probably would not be admissible in a prosecution, its discovery would cause emotional distress. Moreover, while non-criminal information should never be released beyond the initial traffic stop if it has no place in a prosecution, it sometimes manages to find its way into the public domain.[84]

In sum, the search incident to arrest doctrine permits police to search the contents of any container found on the arrestee. Courts already have held that the doctrine applies to the electronic contents of pagers and cell phones and permits the copying of phone numbers and the reading of text messages. If courts take the next step – and they almost certainly will – by applying the search incident to arrest doctrine to the iPhone, officers will be in a position to review incoming and outgoing call histories, scan contact lists, read thousands of emails, view limitless numbers of color photographs and movies, listen to voicemail at the touch of the button, and view many of the internet websites that an arrestee has visited.

IV. Disentangling the iPhone From a Bright Line Rule: Possible Approaches to Cabining the Search Incident to Arrest Doctrine

The difference between the data found on a cell phone and an iPhone is dramatic but, at present, the Fourth Amendment and its search incident to arrest doctrine make no distinction. In this part, I consider what approaches, if any, courts and legislatures might adopt to address this problem.

---

[84] *See, e.g.*, Brian Rogers. *Harris County DA Wants Court To Seal Revealing Emails*, HOUS. CHRON., Dec. 26, 2007, at A1 (describing romantic emails from Harris County District Attorney to secretary that were intended to be produced under seal as part of a civil rights lawsuit but which nevertheless found their way into the public domain).

A. Change Nothing: The Search Incident to Arrest Rule Works Well, So Changing It To Account for New Technology Is Not a Good Idea

While it is undoubtedly troubling to permit suspicionless searches of the many applications of an iPhone, one could plausibly argue that attempting to craft a rule disallowing such searches would be worse. At present, the search incident to arrest doctrine is a bright line rule that is easy for police officers to understand and apply. And courts faced with a search incident to arrest usually have an easy time determining whether the officers' actions were permissible. Compare this to the rest of Fourth Amendment law, which is riddled with exceptions, caveats, and uncertainty.[85] Indeed, the typical Fourth Amendment section of a criminal procedure textbook is at least twice as long as the Fifth Amendment section.[86] Carving out an exception to the search incident to arrest doctrine to deal with the iPhone might afford more privacy protection to a device that holds reams of personal information that society reasonably expects to be protected against government intrusion, but at what cost? There is a colorable argument that any benefit to be had from a new rule would be outweighed by complicating one of the few areas of Fourth Amendment law that is currently intelligible.[87]

---

[85] *See* Craig M. Bradley, *Two Models of the Fourth Amendment*, 83 MICH. L. REV. 1468, 1473-74 (1985) ("In fact, [the] exceptions to the [Fourth Amendment's warrant requirement] are neither few nor well-delineated. There are over twenty exceptions to the probable cause or the warrant requirement or both."); *see also* California v. Acevedo, 500 U.S. 565, 582 (1991) (Scalia, J., concurring in the judgment) (contending that the Fourth Amendment's warrant requirement has "become so riddled with exceptions that it was basically unrecognizable.").

[86] *See, e.g.*, JOSHUA DRESSLER & GEORGE THOMAS, III, CRIMINAL PROCEDURE: PRINCIPLES, POLICIES, AND PERSPECTIVES (2006); RONALD JAY ALLEN ET AL., COMPREHENSIVE CRIMINAL PROCEDURE (2005). Indeed, Justice O'Connor made this very point in opposing a public safety exception to the Miranda doctrine. *See* New York v. Quarles, 467 U.S. 649, 663-64 (1984) (O'Connor concurring in the judgment and dissenting in part) ("The end result will be a finespun new doctrine on public safety exigencies incident to custodial interrogation, complete with the hair-splitting distinctions that currently plague our Fourth Amendment jurisprudence.").

[87] By saying "intelligible" I do not mean to suggest that the search incident to arrest doctrine is sound or logical. To the contrary, I am in agreement with Professor Tomkovicz's recent criticism that the bright-line rule allows police to conduct an automatic search incident to arrest when there is no conceivable way that the arrestee could grab a weapon or destroy evidence. *See* Tomkovicz, *supra* note 9, at 1452-53.

Moreover, as Professor Orin Kerr has explained, not every change in technology necessitates changing the rules of constitutional criminal procedure to be more protective of individuals.[88] The same courts that have made a mess of current Fourth Amendment law may lack the institutional capability to draft rules for emerging technology. As Professor Kerr has explained, "[j]udges cannot readily understand how the technologies may develop, cannot easily appreciate context, and often cannot even recognize whether the facts of the case before them raise privacy implications that happen to be typical or atypical."[89]

While I do not desire that Fourth Amendment law be any more complicated, ultimately, I am not convinced that courts should restrain themselves by applying an ill-fitting bright-line rule to the iPhone.[90] I see two primary reasons.

First, the major informal constraints typically facing police are not present with respect to the iPhone. As Professor Bill Stuntz has explained, police investigations are ordinarily constrained by limited resources and limited time.[91] New technology is typically "expensive" in law and economic terms. Thus, while the Supreme Court has held that there is no Fourth Amendment "search" when police observe backyards from helicopters or planes,[92] that has not enabled police to do so with impunity. Police departments typically cannot afford to buy

---

[88] *See* Kerr, *The Fourth Amendment and New Technologies*, *supra* note 7.

[89] *Id*. at 858-59.

[90] Professor Kerr might very well agree because he has explained that "my argument applies only when technologies are in flux. My concern is the institutional competence of courts and legislatures when facts are changing quickly. As a result, my interest is not whether a given case involves a "technology" in an absolute sense, but rather whether the basic assumptions upon which rules are generated are likely to remain constant or to shift in unpredictable ways." *Id*. at 859.

[91] *See* William J. Stuntz, *Race, Class, and Drugs*, 97 COLUM. L. REV. 1795, 1821 (1998) (explaining how it is lower cost for police to search for drugs in poor neighborhoods where transactions are conducted on the street while it is higher cost to search for drugs in upscale neighborhoods where transactions are behind closed doors and more secretive).

[92] *See* Florida v. Riley, 488 U.S. 445 (1989) (warrantless ariel surveillance does not constitute a Fourth Amendment search); California v. Ciarolo, 476 U.S. 207 (1986) (same).

or rent helicopters, nor do they have the time to file flight plans, get up in the air, and simply look around without suspicion.[93]

With respect to the iPhone, however, the new technology inverts the typical state of affairs because it is the individual, not the police department, who has the new technology. Moreover, unlike flyovers or costly thermal imaging devices,[94] the technology is everywhere. Apple expects to sell more than 10 million iPhones by the end of 2008.[95] In the next decade, tens of millions of drivers will have an iPhone or a substantially similar device in their pockets during many of the nearly thirty million traffic stops that occur each year.[96] And unlike helicopters or thermal imagers, the cost to police in searching is almost nill. A study by the Bureau of Justice Statistics found that police searched the car or the driver in 6.6% of the 27 million traffic stops that occurred in a particular year.[97] Upwards of 470,000 searches were conducted incident to arrest at a traffic stop.[98] If police are already conducting such searches incident to arrest, they can

---

[93] *See* Craig Wong, *Fleet Expansion Chops Earnings*, TORONTO STAR, Sept. 15, 2006, at F5 (average cost of a new helicopter is roughly $500,000); Laura Fasbach, *Should N.J. Governors Go By Chopper? Corzine Smash-Up Prompts a New Look at Air Travel*, NEW JERSEY RECORD, Apr. 23, 2007, at A1 (explaining that state police helicopter costs about $2,800 an hour to pay for fuel and the pilot). Indeed, as one British police officer explained, "we never go on a [helicopter] job without the economics of it being evaluated." Gerry Hold, *Police Helicopter Costs Pounds: 19-a-Minute To Run*, SOUTH WALES ECHO, June 26, 2006, at 6.

[94] In Kyllo v. United States, 533 U.S. 27 (2001) the Supreme Court held that the use of a thermal imaging device to measure heat coming from a house amounted to a Fourth Amendment search requiring probable cause and a warrant. Nevertheless, the Court's 2001 decision turned in large part on the fact that the thermal imaging technology was not in general public use, a factual conclusion that likely would not be true with respect to many such devices today. *See* Orin S. Kerr, *Four Models of Fourth Amendment Protection*, 60 STAN. L. REV. 503, 539 (2007) (explaining that the Supreme Court decides only a handful of cases under its reasonable expectation of privacy test and that lower court decisions involving factual variations tend to be authoritative).

[95] *See supra* note 3.

[96] *See* BUREAU OF JUSTICE STATISTICS, CHARACTERISTICS OF DRIVERS STOPPED BY POLICE, 1999 1, 4 (2002) (estimating that in 1999 "19.3 million drivers age 16 or older, or 10.3% of all licensed drivers were stopped by police" and that because many drivers were stopped more than once a total of 27 million traffic stops occurred).

[97] *See id*. at 10.

[98] *See id*.

simply take a few extra moments to seize the iPhone, turn it on, and start rummaging through it.[99]

The iPhone drastically changes the amount of private information that can be accessed during a search incident to arrest. And unlike thermal imaging devices or airplane flyovers, iPhone searches could potentially affect millions of people. Put simply, the stakes are higher and it is worth considering whether the search incident to arrest doctrine might be melded to fit this problem.

B. Change Everything: Limiting the Search Incident to Arrest Doctrine in All Police Interactions to a Search Related to the Crime of Arrest

The most drastic change to the search incident to arrest doctrine – short of abolishing it altogether – would be to limit officers to searching for evidence of the crime for which the suspect was arrested. Thus, if the driver were arrested for drug possession, police could search anywhere drugs might be found. But if the driver were arrested for failure to wear a seatbelt, a search for drugs would be impermissible. Justice Scalia advocated this revision to the search incident to arrest doctrine in his 2004 concurring opinion in *Thornton v. United States*, in which the Supreme Court upheld the search of the passenger compartment of a "recently" occupied car. Joined by Justice Ginsburg, Justice Scalia argued that searching a vehicle incident to arrest should only be permitted when "it is reasonable to believe evidence related to the crime of arrest might be found in the vehicle."[100] Justice Scalia's view departs from the traditional reasons for the search incident to arrest doctrine. Instead of conducting the searches to prevent the arrestee from harming the officer or destroying evidence, such searches would be justified as "evidence-gathering" exercises that can be conducted because of "a reasonable belief that evidence [will] be found."[101]

---

[99] I will concede however that good police officers conducting a standard traffic arrest might be reluctant to spend significant time searching an iPhone because they simply have no idea what they would be looking for or where incriminating information might be hidden. Unlike in the case of drugs, which can be held in only a few areas and which are relatively easy to uncover during a search incident to arrest, officers would likely have no idea which emails or websites to browse on an iPhone to find incriminating information. Of course, it is not just the "good" police officers, but also the overly aggressive officers that the Fourth Amendment must be concerned with. I am grateful to Professor Orin Kerr for making this point to me.

[100] *Thornton*, 541 U.S. 632 (Scalia, J., concurring in the judgment).

[101] *Id*. (Scalia, J., concurring in the judgment).

Justice Scalia wrote for only himself and Justice Ginsburg in expressing this view, so we might be inclined to dismiss this approach as simply being unlikely to occur. However, as Professor James Tomkovicz has recently explained, with Chief Justice Roberts and Justice Alito not yet having a chance to address this approach, and with Justice Stevens and Justice Souter on record as being very dissatisfied with the current state of the search incident to arrest doctrine, it is not altogether implausible to assume that Justice Scalia's position may some day command a majority.[102]

Besides its unlikely adoption, perhaps a stronger objection to Justice Scalia's approach is that the "evidence gathering" approach lacks doctrinal justification. Searching to gather evidence during a search incident to arrest is troubling because it would permit searches based on suspicion – rather than officer safety – that involve less than probable cause.[103] Likewise, such an approach would offer no justification for permitting searches of the passenger compartment incident to arrest but not the trunk of the vehicle.[104]

On the plus side, Justice Scalia's approach would solve the iPhone dilemma by re-conceptualizing the entire search incident to arrest doctrine, without requiring a special rule for particular new technology.[105] If police could

---

[102] *See* Tomkovicz, *supra* note 9, at 1451-52 ("It is not hard to imagine at least three of these Justices endorsing the "evidence-gathering" rationale that Justice Scalia relied upon to sustain the search in Thornton itself.").

[103] *See* David S. Rudstein, *Belton Redux: Reevaluating Belton's Per Se Rule Governing the Search of an Automobile Incident to Arrest*, 40 WAKE FOREST L. REV. 1287, 1345-46 (2005); *see also* Tomkovicz, *supra* note 9, at 1464 ("[Justice Scalia never asserts, because it would not be defensible to do so, that an arrest for an evidentiary offense will always, or nearly always, satisfy the constitutional standard -- probable cause to believe that an item of interest to the government will be found in surrounding areas."); Dripps, *The Fourth Amendment and the Fallacy of Composition, supra* note 14, at 404 ("The police, incident to arrest, must have some reason -- but not probable cause -- to suspect evidence, contraband or weapons. That's a standard, not a rule, and a fairly vague standard at that."); *but see* Edwin J. Butterfoss, *Bright Line Breaking Point: Embracing Justice Scalia's Call for the Supreme Court To Abandon an Unreasonable Approach to Fourth Amendment Search and Seizure, Law*, 82 TULANE L. REV. 77, 107-08 (2007) (downplaying this concern).

[104] *See* Tomkovicz, *supra* note 9, at 1471 ("Why is it not logical to believe that evidence located in the arrestee's vicinity might be found inside her trunk?").

[105] *See* Kerr, *The Fourth Amendment and New Technologies*, *supra* note 7, at 858-59 (cautioning against courts generating new and individual rules each time new technology raises unforeseen issues).

only search for evidence related to the crime of arrest, most traffic stops would not permit searches of an iPhone's contents. And even when police were permitted to search an iPhone incident to arrest, the scope of the search would be limited. If an officer arrested a driver for possession of drugs with intent to distribute, it would make sense to search his text messages for further evidence of the crime, since that function is commonly used in furtherance of drug sales.[106] But it would not seem to be permissible for the officer to search through the arrestee's pictures under the iPhoto function or the history section under his internet browser because such applications likely have nothing to do with drug sales. A rule limiting the search incident to arrest exception to the crime of arrest would prevent police from roaming at large among the thousands of pages of data held in the iPhone.

C. Change By a Different Sovereign: Encouraging State Legislatures to Adopt a More Protective Rule

Scholars dispute the ability of state courts to provide greater protection of constitutional rights than federal courts.[107] Although the debate rages, it is undisputed that, in the criminal procedure context, a number of states have imposed greater restrictions on searches and seizures under the Fourth Amendment and state constitutional equivalents.[108] Notably, numerous state courts have cabined the search incident to arrest exception under state law.[109]

One approach states courts might take is the one advocated by Justice Scalia and discussed in Part IV.B above. If the Supreme Court of the United States refuses to limit the search incident to arrest doctrine to searches of the arrestee for weapons and evidence of the crime for which he has been arrested,

---

[106] *See, e.g.*, United States v. Slater, 971 F.2d 626, 637 (10th Cir. 1992) (explaining that a cell phone is a "recognized tool of the trade in drug dealing").

[107] The literature on this subject is vast. For two prominent and contrasting viewpoints, compare James A. Gardner, *The Failed Discourse of State Constitutionalism*, 90 MICH. L. REV. 761 (1992) with William J. Brennan, Jr., *State Constitutions and the Protection of Individual Rights*, 90 HARV. L. REV. 489 (1977).

[108] *See* Barry Latzer, *Toward the Decentralization of Criminal Procedure: State Constitutional Law and Selective Disincorporation*, 86 J. CRIM. L. & CRIMINOLOGY, 63, 92 (1996) ("A good chunk of Fourth Amendment doctrine, or some more protective variant of it, is now a part of the state constitutional jurisprudence of most states.")

[109] *See id.* at 94 nn. 131, 133 (collecting nearly twenty cases from numerous states that limit the search incident to arrest exception to narrower circumstances than authorized by the Supreme Court of the United States).

then the state courts could look to their own constitutions to do so. To date, a handful of state courts have adopted this approach.[110]

Moreover, we should look beyond state courts to consider state legislatures. While new criminal procedure rules typically come from courts, it would be a mistake to ignore possible legislative solutions.[111] And, indeed, legislatures have taken action in the past to narrow what they believe to be an overly broad search incident to arrest doctrine.

In the wake of the Supreme Court's expansive 1973 decision in *United States v. Robinson* permitting police to open all containers on a person incident to a lawful arrest, the Massachusetts legislature adopted statutory language specifically designed to narrow the search incident to arrest doctrine.[112] For over thirty years, that statute has provided that in Massachusetts,

> A search conducted incident to an arrest may be made only for the purposes of seizing fruits, instrumentalities, contraband and other evidence of the crime for which the arrest has been made, in order to prevent its destruction or concealment; and removing any weapons that the arrestee might use to resist arrest or effect his escape. Property seized as a result of a search in violation of the provisions of this paragraph shall not be admissible in evidence in criminal proceedings.[113]

Other state legislatures could revise their codes to follow the Massachusetts model. Or those legislatures could take a different approach and

---

[110] *See, e.g.*, State v. Ringer, 674 P.2d 1240 (Wash. 1983); State v. Caraher, 653 P.2d 942 (Or. 1982).

[111] *See, e.g.*, Douglas A. Berman, *Foreword: Addressing Capital Punishment Through Statutory Reform*, 63 OHIO ST. L.J. 1, 10 (2002) (suggesting that we "turn to legislatures to find some hope within an otherwise discouraging story about the reform of capital systems"); Ronald F. Wright, *Parity of Resources for Defense Counsel and the Reach of Public Choice Theory*, 90 IOWA L. REV. 219, 223 (2004) (arguing that indigent defense funding is more likely to improve if the reform comes from legislatures rather than the judiciary).

[112] *See* Commonwealth v. Madera, 521 N.E.2d 738 (Mass. 1988) (discussing reason for passing the statute); Commonwealth v. Toole, 448 N.E.2d 1264 (Mass. 1983) (same).

[113] M.G.L.A. 276 § 1.

authorize the seizure of iPhones or other wireless devices incident to arrest but not permit warrantless searches of those devices without a warrant.[114]

The key question is how likely are legislatures to take action to protect iPhones from warrantless searches. Obviously, legislatures are not typically in the business of limiting police officers' ability to conduct criminal investigations.[115] To the contrary, legislators' interests are typically in line with those of law enforcement and they therefore enact statutes that favor expansive police authority.[116] Yet, when it comes to iPhones the situation might be different. Unlike the faceless backdrop in which legislators typically award police great investigatory powers, the scenarios in which an iPhone can be searched incident to arrest are likely to hit home with legislators. As typically middle or upper-class individuals with teenage or young adult children, legislators are one of the demographic groups likely to purchase iPhones.[117] And while legislators rarely commit the crimes of murder or rape,[118] as mostly

---

[114] Justice Stevens has long advocated a similar approach permitting police to search the passenger compartment of an automobile incident to arrest but not open any of the containers found therein. *See* Robbins v California, 453 U.S. 420, 451-52 (1981) (Stevens, J. dissenting); Thornton v. United States, 541 U.S. 615, 634 (2004) (Stevens, J., dissenting). *See also* Rudstein, *supra* note 103, at 1340-41 (discussing but ultimately rejecting this approach because it does not eliminate the problem of pretextual arrests).

[115] *See* Donald A. Dripps, *Criminal Procedure, Footnote Four, and the Theory of Public Choice; Or, Why Don't Legislatures Give a Damn About the Rights of the Accused*?, 44 SYRACUSE L. REV. 1079 (1993); *see also* William J. Stuntz, *The Uneasy Relationship Between Criminal Procedure and Criminal Justice*, 107 YALE L.J. 1, 12 (1997) ("Perhaps more so than anywhere else in constitutional law, in criminal procedure the broad exercise of judicial power tends to be justified precisely by the legislators' unwillingness to protect constitutional interests.").

[116] *See* Stuntz, *Pathological Politics of Criminal Law*, *supra* note 13, at 539 (explaining that "police benefit from laws that criminalize street behavior that no one wishes actually to punish" and that "cheaper policing should be a boon to police and legislators alike").

[117] At least at this time, it is likely that legislators' children are the primary demographic group that Apple and its competitors are targeting. *See* Devona Waler, *In Southwest Florida, Apple Geeks Aren't Sold*, SARASOTA HERALD TRIB., June 27, 2007 ("[T]he iPhone's ideal demographic: a young, professional, tech-savvy gadget kind of guy who came into adulthood with an affinity for everything Apple."). As the devices become more ubiquitous however, middle age men and women will increasingly own them for themselves rather than purchasing them as gifts for children.

[118] *See* Craig S. Lerner, *Legislators as the "American Criminal Class": Why Congress (Sometimes) Protects the Rights of Defendants*, 2004 U. ILL. L. REV. 599, 622-23 (2004)

middle-class white men they are statistically more likely to be involved in computer crimes such as financial misconduct or fraud.[119] It is evidence of these crimes that might accidentally turn up during a search of an iPhone incident to an arrest for running a stop sign or driving while intoxicated. Moreover, while legislatures are unlikely to have illegal child pornography on their computers or iPhones, it is reasonable to assume many male legislators have downloaded "run-of-the-mill" pornography.[120] While this material is not illegal, its discovery would be embarrassing and politically devastating.[121]

And as Professor Craig Lerner has demonstrated, significant legislative protections for criminal defendants often arises in response to a particular legislator being put through the criminal justice process.[122] Thus, while legislators are tough on crime and reluctant to reduce punishments or remove old crimes from the books, it is reasonable to expect that legislators will create criminal procedure protections that track their own self-interest.[123] It is therefore possible that legislators will enact laws limiting the search of iPhones incident to arrest.

(explaining that most indictments of federal legislators have been for non-violent offenses, particularly financial crimes).

[119] *See id.* at 624 (explaining that in addition to financial crimes, between 1970 and 2000 "six members of Congress were indicted for sex-related offenses, and several others have been investigated by their colleagues for sexual improprieties").

[120] *See* John MacIntyre, *Record Credit Card Offers*, DESERET MORNING NEWS, July 31, 2005, at M08 (noting that 75% of survey respondents said they accidentally found themselves on a pornographic website at work and 16% admitted to doing so intentionally). For a more bawdy assessment, consider the song "The Internet is for Porn" from the musical Avenue Q.

[121] *See* Alan Bernstein, *County GOP Nervous About Fallout From Email Scandal*, HOU. CHRON., Jan. 10, 2008 (describing uproar when pornography was found on the office computer of the elected District Attorney of Harris County).

[122] *See* Lerner, *supra* note 118, at 632-661. For a recent and excellent argument challenging the view that criminal legislation tends to be entirely one-directional and that legislators never decriminalize conduct, see Darryl K. Brown, *Democracy and Decriminalization*, 86 TEX. L. REV. 223 (2007).

[123] *See* William J. Stuntz, *The Political Constitution of Criminal Justice*, 119 HARV. L. REV. 780, 796 (2006) (explaining that "legislatures have been a good deal quicker to expand criminal procedure protections than to contract criminal liability").

Moreover, legislators have further incentive to enact such restrictions to please their constituents. While it is unlikely that a lobby will form to press for a law exempting iPhones from the search incident to arrest doctrine, it is likely that in the near future a prominent business executive or other powerful and connected individual from the upper-class will be embarrassed when his iPhone is searched at a traffic stop. And when those middle and upper-class individuals – the type who vote and, more importantly, have money to make campaign contributions – press for some legislative action, lawmakers will have little reason to refuse them. The soft on crime label tends not to stick when the new law benefits a considerable majority and protects the middle-class right to privacy.[124]

D. Change at the Margins: The Open Application Test

A more modest revision to the search incident to arrest doctrine, but one that nevertheless would eliminate the current bright line rule, would be for courts to adopt an "open application" test. Under an open application approach, police would be permitted to search any open application on the iPhone incident to arrest but would not be authorized to look through applications that are closed when the arrest is made. Thus, an individual who took steps to close the iPhoto application could expect the pictures contained therein to remain private. More significantly, an individual who kept her iPhone off entirely could avoid any search of its contents.

There are at least two problems with this approach: First, it would be very difficult to know if officers are telling the truth when they say an application was open. Because an iPhone can be turned on simply by tapping the touch screen and applications can be activated simply by touching an icon, it would be easy for officers to testify that an application was open at the time of arrest, even if it was in fact closed.[125] Of course, the prospect of police lying runs throughout

---

[124] *See* Marc Mauer, *Why Are Tough on Crime Policies So Popular*, 11 STAN. L. & POL'Y REV. 9, 16 (1999) ("[T]he conclusion that crime policy has shifted toward a 'get tough' strategy needs to be tempered with the recognition that when the perceived offenders are white and/or middle class, policymakers appear to be more receptive to rational policy considerations.").

[125] Unfortunately, many experts believe that officers lie or, at best, fudge facts to ensure that guilty defendants are convicted. For the classic statement, see ALAN DERSHOWITZ, THE BEST DEFENSE xxi (1982) ("Almost all police lie about whether they violated the Constitution in order to convict guilty defendants."). *See also* Christopher Slobogin, *Testilying: Police Perjury and What To Do About It*, 67 U. COLO. L. REV. 1037, 1041 (1996) ("the existing literature demonstrates a widespread belief that testilying is a frequent occurrence"); Myron R. Orfield, *The Exclusionary Rule and Deterrence: An Empirical Study*

Fourth Amendment jurisprudence. Police could just as easily lie and say they received consent to search the trunk of a vehicle when they in fact did not, or that they smelled marijuana when in fact there was no such smell.

A second and more compelling problem with the open application test is that it runs afoul of one of the original justifications for the search incident to arrest doctrine: preventing the destruction of evidence.[126] Just as police could quickly open a closed application on the iPhone, so too could a suspect. An arrestee skilled at using his iPhone might be able to turn on the device, select an application, and destroy text messages, emails, photos, or other evidence in a matter of seconds.

Given that the Supreme Court has adopted a fiction that almost any physical evidence – closed or open – in the arrestee's grasp could potentially be destroyed, even if the arrestee is handcuffed[127] – it would make little sense to draw a line forbidding searches of closed applications on an electronic device that an arrestee could easily open and destroy.[128]

E. Changing the Bright Line Rule: Limiting the Search Incident to Arrest Doctrine to Five Steps of Searches

Another solution would be to limit police to taking only a fixed number of steps when searching the contents of an iPhone incident to arrest. For instance,

---

of Chicago Narcotics Officers, 54 U. CHI. L. REV. 1016, 1049-50 (1987) (concluding that more than seventy-five percent of officers surveyed believed that police shade the facts regarding probable cause, and that nineteen percent believed perjury was reasonably common.).

[126] *See Chimel*, 395 U.S, at 763 ("[I]t is entirely reasonable for the arresting officer to search for and seize any evidence on the arrestee's person in order to prevent its concealment or destruction.").

[127] *See* Carol A. Chase, *Cars, Cops, and Crooks: A Reexamination of Belton and Carroll With an Eye Toward Restoring Fourth Amendment Privacy Protection to Automobiles*, 85 OR. L. REV. 913, 918 n.31 (2006) (citing "[s]everal courts [that] have approved the search incident to arrest of an automobile notwithstanding that the suspect has been handcuffed and placed inside a police cruiser").

[128] *See* Tomkovicz, *supra* note 9, at 1427 (explaining that while the pre-*Chimel* v. California era was marked by drastic changes in the scope of the search incident to arrest doctrine, "during the more than thirty-five years since its radical, contractive swing in *Chimel*, the search incident pendulum has moved slowly, yet steadily, in the opposite direction").

courts could set a bright-line rule that police can take five steps, but no more, when rummaging through an iPhone's contents. As with the open application test, this solution likely causes more problems than it would solve, but is worth exploring briefly.

The primary virtue of the search incident to arrest doctrine is that it provides bright line rules that are easily understandable. Thus, police know that they can open an arrestee's wallet but cannot search the trunk of his car. The primary detriment of the search incident to arrest doctrine is that it permits the police to rummage through numerous layers of enclosed materials, even if there is no probable cause to believe contraband is buried beneath. This problem is particularly vexing with respect to the iPhone because it contains layer upon layer of data. Police conceivably could (1) turn on the phone; (2) open an internet browser; (3) type in a web-based email account such as www.hotmail.com; (4) log into the account (if the user id and password are saved); (5) open a folder of messages; (6) open a particular message; (7) read the message; (8) open the attachment to the message; and so forth.

One compromise approach would be to create a bright-line "five-level deep" rule (or some other number) limiting the search of iPhones to a total of five steps. Under such a rule, the police could search five levels deep into the iPhones contents, but no further. Thus, for example, police could (1) turn on the phone; (2) open the internet browser; (3) type in a web-based email account such as www.hotmail.com; (4) log into the account (if the user id and password are saved); and (5) open a folder of messages. If the officer completes the fifth step without finding anything incriminating that could be destroyed, the officer would need to stop searching. To search further, the officer would need to procure a warrant.

The main virtue to this approach is that it puts an outer limit on how far police may search electronic data while at the same time leaving intact a relatively bright-line rule that makes clear to police exactly how far they can go. On the other hand, whether police exceeded the five steps would certainly be debated in individual cases. Judges would have to make findings of fact ranging from the simple – was the phone already turned on when the search incident to arrest began, thus not counting it as one of the five steps – to the more fuzzy inquiries – for instance, when police linked from one webpage to another were they taking two steps or just one. This sort of fact-finding is exactly what courts have tried to avoid by advocating a bright-line search incident to arrest rule.

Perhaps more obviously troubling, selecting a certain number of searches – for instance, saying that police can search five levels deep into an iPhone, but not six – is terribly arbitrary. While courts could say the number of levels is

correlated to the likelihood that the arrestee could reach that data and destroy it, selecting a level would still be beyond the institutional capacity of courts.[129] Moreover, no comparable five-step rule exists for searches of tangible evidence found during a typical search incident to arrest. If police can exceed five steps to discover drugs in a small bag hidden inside a box lying under some papers in the glove compartment of a car, it is difficult to justify a five-step rule only for iPhones.

F. Distinguishing Between Data on the Device and Data Accessible From the Device

Finally, courts could try to draw a conceptual line between data that is "on" or "in" the iPhone and data that is simply "accessible" via the iPhone. This would essentially be drawing a line between the iPhone's internet browser function and most of its other applications. An arrestee's pictures in his iPhoto application, his text messages, and his incoming call history are "on" or "in" the phone. If internet service were cut off, the owner of the phone would still be able to access these features because the data has been downloaded to the phone. By contrast, web-based email accounts or other material that an individual accesses over the internet are not typically downloaded to the phone and are instead, for lack of a better phrase, simply floating around on electronic servers in cyberspace. Because such data is not physically present on the iPhone without proactively seeking it out, courts and legislatures could draw a line forbidding such searches incident to arrest while allowing police to search applications that have data permanently on the iPhone.

One wrinkle to this approach might be if the internet browser that allows the user to access information floating in cyberspace is open when the officer searches the iPhone. For instance, what if the officer conducting the search incident to arrest discovers that the internet browser is open to a web-based email account and that the selected email has incriminating information in it? Surely it would not make sense to say that the officer could search the rest of the iPhone's applications but not the open web-based email. One solution to this problem would be to harken back to the original search incident to arrest jurisprudence that allows a full-scale search of some areas beyond the person of the arrestee if the area is in the immediate grabbing space.[130] For instance, the search incident to arrest doctrine typically does not allow a search of the trunk of a vehicle, but if the trunk is open and the arrestee is standing near it, then such a

---

[129] *See* Kerr, *The Fourth Amendment and New Technologies*, *supra* note 7, at 858-59.

[130] *See Chimel*, 395 U.S. at 763.

search is permissible.[131] In the hypothetical scenario outlined above, web-based email can be analogized to the trunk of a car. The web-based email (or banking information, or myspace page) would typically be considered to be outside the grabbing space of the suspect, however, when the email is open in the internet browser it would be within the immediate grabbing space.

Thinking in terms of physical tangible space, an approach that differentiates between material downloaded onto the iPhone and material that is simply accessible via the iPhone seems to make sense. Just as officers could search the cigarette pack in Mr. Robinson's pocket, they can search the photos he is carrying on his iPhone. And just as the police could not search Mr. Robinson's medical records stored in his house (rather than on his person), the police could not search his electronic data not currently downloaded onto his phone.

Yet, the comparison with Robinson's medical records fails at a certain level when we consider that the purpose of the search incident to arrest doctrine is to prevent destruction of evidence. Of course, Mr. Robinson could not destroy the medical records in his house while being arrested at a traffic stop. Yet, he could quickly open his internet browser, log onto his web-based email account and destroy incriminating evidence without ever leaving the traffic stop. Nevertheless, this approach is conceptually promising because it does not require a wholesale revision of the search incident to arrest doctrine, which has been framed with tangible physical evidence in mind.

* * *

At the end of the day, all five approaches appear to be somewhat unsatisfying. Permitting the police to search only for evidence related to the purpose of arrest would improve the doctrine for all cases, not just those involving iPhones, but it has recently been rejected by a majority of the Supreme Court. Asking state legislatures to limit police to search incident to arrest only for evidence related to the arrest is plausible but highly unlikely to occur in many states. An open application test may encourage police deception and will likely create the types of factual disputes that the bright line search incident to arrest doctrine was designed to avoid. A five-step limit will likewise raise factual questions that are best avoided. Finally, while a rule that differentiates between data on the iPhone and data accessible via the phone is the most conceptually pure, it does not account for the possibility that arrestees could still destroy data that is merely accessible via the iPhone. Nevertheless, despite the flaws associated with each proposal, all are likely preferable to doing nothing and

---

[131] *See, e.g.*, State v. Alderman, 2003 WL 21965127 (Wash.App. Aug. 19, 2003) at *3 (upholding search of trunk that was "partially open" under the search incident to arrest doctrine).

allowing police to search thousands of pages of electronic data without probable cause or a warrant.

Conclusion

Under the search incident to arrest doctrine, police may search the entire body and immediate grabbing space of an arrestee, including the contents of all containers, without any probable cause. Because almost all traffic infractions are arrestable offenses, police have enormous opportunity to conduct such searches incident to arrest. In the near future, these already high stakes searches will become even more important because millions of drivers will not only possess containers that hold a few scattered papers, such as wallets or briefcases, but also iPhones capable of holding tens of thousands of pages of personal information. If current Fourth Amendment jurisprudence is extended to its logical conclusion, officers who arrest drivers for traffic infractions will be permitted to search the call histories, text messages, email, photos, movies, and internet browsing history on iPhones with no suspicion of wrongdoing whatsoever. Courts and legislatures can attempt to minimize this invasion of privacy by changing the legal rules to require that searches be related to the purpose of the arrest, by limiting searches to applications that are already open, by restricting suspicionless investigation to a small number of discrete steps, or by limiting searches to data already downloaded onto the iPhone, rather than data that is merely accessible through the iPhone's internet connection.
